Areas where native woodland is highly developed structural diversity will be managed as minimum intervention. Management interventions will be focussed on the removal and control of non-native species, management of health and safety, and ash die back. Felled timber to remain on site.

Some areas are dominated by middle-aged beech. In these instances, the approach will be to gradually remove the larger of the seed bearing trees (but not veterans) to create opportunities for the recovery of native vegetation. Felled timber to be retained on site.

There is a working agreement with the neighbouring Bonskeid estate to remove timber via its estate road, subject to detailed agreement and condition assessment.

Some areas have a well developed canopy of oak with a lower understorey of beech and sycamore. In these cases there is an opportunity to remove the understorey while maintaining a good canopy of oak. Timber to be removed where access is possible.

Some areas have an understorey of hazel which seems to have been historically managed. Investigate opportunities for the reintroduction of hazel coppice to reinvigorate the stools. Subject to survey for rare lichens.

Some areas of conifers around the Linn of Tummel Woods comprise Sitka spruce, Western hemlock and European silver fir interspersed with larch, Douglas fir and regenerating broadleaves. These species cast a heavy shade and regenerate freely at the expense of native ground flora. They area also becoming increasingly unstable. These should be removed through selective felling and retaining less undesirable species.

The woodlands around the confluence of the rivers includes stands of mature Douglas fir, Scots pine and larch from the early-to-mid 20th Century. These are fairly benign in respect of the native woodland flora, and have developed a strong visual character. These will be retained as cathedral groves and managed to develop large crowns and old trees through occasional thinning.

Clearfell small patches of dense and unthinned conifers that have little understorey or natural regeneration
